Your Computer

KeepItSafe
Backup Servers

1. Data is automatically prepared to begin the off-site backup. This is usually scheduled to occur after hours.

2. Data is compressed and then encrypted to commercial level standards.

3. Data is then securely transmitted using the same encryption level as International Banking Corporations.

4. Data is validated and saved to two separate backup servers. This is only accessible by you.

What can KeepItSafe back up?

Anything on your computer or server can be backed up using KeepItSafe. KeepItSafe supports the correct method of backing up the following:

- Payroll Systems
- Documents
- Exchange Server
- Emails
- Accounting Systems
- Plus more…

How secure is it?

All data is encrypted before it leaves your computer. It is then transferred to our KeepItSafe data centre; where it is stored in its encrypted state behind a managed firewall. The data centre is only accessible by authorised personnel and has around-the-clock monitoring. Your information is also backed up to a second KeepItSafe data centre in another location. KeepItSafe uses commercial-level encryption for storage and transfer.

Where is my data stored?

Your data is backed up to a secure New Zealand data facility. KeepItSafe provides you with the ability to easily restore individual files or folders at any time. If the amount of information to be restored is large, then KeepItSafe can deliver your data to you on a disk or hard drive. Web access is also available to restore from another location if required.

HOW IT WORKS

The KeepItSafe Online Backup automates the process of backing up your important computer records and transferring them to a secure off-site location.
KeepItSafe software is installed on your server or computers and schedules are set to automatically back them up. This information is transmitted via a secure link using your existing Internet connection to KeepItSafe data centres. The New Zealand-based data facilities are fully secured and monitored by trained support technicians.
You have full access to your information and can restore all or part of it at any time, as long as you have the encryption key.

Why choose KeepItSafe

- Fully automated, removing human intervention.
- Data is safely and automatically secured offsite.
- You have full access to your data 24/7.
- KeepItSafe is the preferred supplier to the medical sector.
- KeepItSafe is security-certified by the Ministry of Justice, New Zealand.
- KeepItSafe is a dedicated computer backup provider.
- KeepItSafe backs up PHO's and medical centres throughout New Zealand.
- New Zealand's most trusted backup provider.

Why should I have this system?

- Protect your business from financial loss.
- Minimise downtime by having readily available access to your computer information.
- Automate the backup process. KeepItSafe requires no human intervention.
- Fully monitored. Daily emails are sent to notify you of successful backups or problems.
- Protection from human error, hardware failure, theft, fire, or natural disaster.
